Alert Detail

High	External Redirect
Description	URL redirectors represent common functionality employed by web sites to forward an incoming request to an alternate resource. This can be done for a variety of reasons and is often done to allow resources to be moved within the directory structure and to avoid breaking functionality for users that request the resource at its previous location. URL redirectors may also be used to implement load balancing, leveraging abbreviated URLs or recording outgoing links. It is this last implementation which is often used in phishing attacks as described in the example below. URL redirectors do not necessarily represent a direct security vulnerability but can be abused by attackers trying to social engineer victims into believing that they are navigating to a site other than the true destination.
URL	http://localhost:9990/images
Method	GET
Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
URL	http://localhost:9990/images/advertisement
Method	GET
Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
URL	http://localhost:9990/images/footer
Method	GET
Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
URL	http://localhost:9990/images/header
Method	GET
Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
URL	http://localhost:9990/images/top-categories
Method	GET
Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
URL	http://localhost:9990/static
Method	GET

Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
URL	http://localhost:9990/static/css
Method	GET
Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
URL	http://localhost:9990/static/js
Method	GET
Attack	7780375548633760839.owasp.org
Evidence	7780375548633760839.owasp.org
Other Info	The response contains a redirect in its Location header which allows an external Url to be set.
Instances	8
Solution	Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use an allow list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. Do not rely exclusively on looking for malicious or malformed inputs (i.e., do not rely on a deny list). However, deny lists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright. When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if you are expecting colors such as "red" or "blue." Use an allow list of approved URLs or domains to be used for redirection. Use an intermediate disclaimer page that provides the user with a clear warning that they are leaving your site. Implement a long timeout before the redirect occurs, or force the user to click on the link. Be careful to avoid XSS problems when generating the disclaimer page. When the set of acceptable objects, such as filenames or URLs, is limited or known, create a mapping from a set of fixed input values (such as numeric IDs) to the actual filenames or URLs, and reject all other inputs. For example, ID 1 could map to "/login.asp" and ID 2 could map to "https://www.example.com/". Features such as the ESAPI AccessReferenceMap provide this capability. Understand all the potential areas where untrusted inputs can enter your software: parameters or arguments, cookies, anything read from the network, environment variables, reverse DNS lookups, query results, request headers, URL components, e-mail, files, databases, and any external systems that provide data to the application. Remember that such inputs may be obtained indirectly through API calls. Many open redirect problems occur because the programmer assumed that certain inputs could not be modified, such as cookies and hidden form fields.

CWE Id	601
WASC Id	38

Plugin Id	20019

Medium	CSP: Wildcard Directive
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks. Including (but not limited to) Cross Site Scripting (XSS), and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.
URL	http://localhost:8880/
Method	GET
Attack	
Evidence	default-src 'none'
Other Info	The following directives either allow wildcard sources (or ancestors), are not defined, or are overly broadly defined: frame-ancestors, form-action The directive(s): frame-ancestors, form-action are among the directives that do not fallback to default-src, missing/excluding them is the same as allowing anything.
Instances	1
Solution	Ensure that your web server, application server, load balancer, etc. is properly configured to set the Content-Security-Policy header.
Reference	https://www.w3.org/TR/CSP/ https://caniuse.com/#search=content+security+policy https://content-security-policy.com/ https://github.com/HtmlUnit/htmlunit-csp https://developers.google.com/web/fundamentals/security/csp#policy_applies_to_a_wide_variety_of_resources

Instances	11
Solution	Modern Web browsers support the Content-Security-Policy and X-Frame-Options HTTP header set on all web pages returned by your site/app. If you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY. Alt implementing Content Security Policy's "frame-ancestors" directive.
Reference	https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/X-Frame-Options
CWE Id	1021
WASC Id	15
Plugin Id	10020

Low	**Application Error Disclosure**
Description	This page contains an error/warning message that may disclose sensitive information like the location of the file that produced the unhandled exception. This information can be used to launch further attacks against the web application. The alert could be a false positive if the error message is found inside a documentation page.

Solution	For secure content, ensure the cache-control HTTP header is set with "no-cache, no-store, mus
Reference	https://cheatsheetseries.owasp.org/cheatsheets/Session_Management_Cheat_Sheet.html#web https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Cache-Control https://grayduck.mn/2021/09/13/cache-control-recommendations/
CWE Id	525
WASC Id	13
Plugin Id	10015

Informational	**Retrieved from Cache**
Description	The content was retrieved from a shared cache. If the response data is sensitive, personal or user-specific, this may result in sensitive information being leaked. In some cases, this may even result in a user gaining complete control of the session of another user, depending on the configuration of the caching components in use in their environment. This is primarily an issue where caching servers such as "proxy" caches are configured on the local network. This configuration is typically found in corporate or educational environments, for instance.

Method	GET
Attack	
Evidence	Age: 413264
Other Info	The presence of the 'Age' header indicates that that a HTTP/1.1 compliant caching server is in use.
Instances	1
Solution	Validate that the response does not contain sensitive, personal or user-specific information. If it does, consider the use of the following HTTP response headers, to limit, or prevent the content being stored and retrieved from the cache by another user: Cache-Control: no-cache, no-store, must-revalidate, private Pragma: no-cache Expires: 0 This configuration directs both HTTP 1.0 and HTTP 1.1 compliant caching servers to not store the response, and to not retrieve the response (without validation) from the cache, in response to a similar request.
